#### Introduction

The close relationship between the age composition of the population and facilities and service needs has prompted the Nassau-Suffolk Regional Planning Board to provide extensive tables and detailed analysis of this most important characteristic of Long Island's residents.

In selecting the data items to be included in this report, the staff attempted to anticipate and furnish answers for the most frequently asked questions. Of necessity choices were made and information was summarized by age classes or geographic areas that will not prove equally helpful to all uses of small area data. A printout of the First and Second Count Census Tapes is on file at the Nassau-Suffolk Regional Planning Board offices in Hauppauge and may be consulted by the reader who cannot find the answers to his particular questions in Volume 3.

Volume 3, Age of the Population, is similar in format to Volume 2,

Color and Race. The first section of the analytical text delineates
the age structure of the Region's population as reported by the

1970 Census and describes the changes that have occurred since 1960.
The second section describes the age profiles of Nassau and Suffolk
residents and indicates the nature and magnitude of the alterations
that have taken place during the last decade, while the third section
furnishes comparable information for the fifteen towns and cities.
The fourth provides a brief discussion of the distribution by minor
civil division and place of persons in six selected age groups and
highlights significant ten year changes in each. The fifth deals

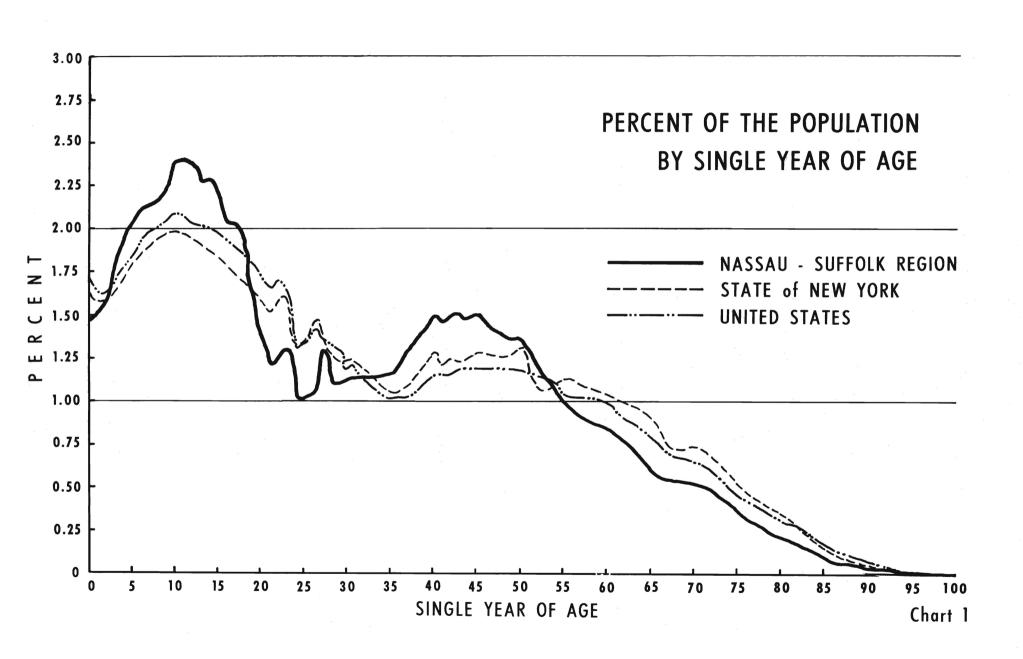

with pre-school and elderly population and the median age of persons by census tract. The final section presents a comparison of actual and projected 1970 population for the Nassau-Suffolk Region and its constituent counties.

A few of the terms used in this report may require clarification. Age refers to the number of years completed at the time of an individual's last birthday. The term "cohort" as used in demographic discussions means a class of persons all of whom were born in the same year or during the same five-year period. The median age of any group of persons is the number of years of age of the individual-real or imaginary—whose age falls at the midpoint of an array of the ages of all of the individuals who constitute the group. There is an equal number of persons whose age is above and whose age is below the median.

# Age Composition of the Population of the United States, New York State and The Nassau-Suffolk Region

The Nassau-Suffolk age profile; that is, the distribution of the population by single year of age, differs somewhat from that reported both for the nation as a whole and for the State of New York. Chart 1, p. 3, and Appendix Table I, The United States, New York State, The Region and Constituent Counties, Percent of the Population by Single Year of Age, 1970 present this information in graphic and tabular form.

The Bi-County Region has a smaller proportion of its population than either the nation or the state classified as "under one year" and "one year old"; a proportion below that of the nation, but

above that of the state listed as "two years old"; and a greater proportion than both the United States and New York State for each of the years three through seventeen. At age eighteen, the pattern changes as Nassau-Suffolk's relative share drops below that of the nation, but remains above that of the state. Commencing with age nineteen and continuing through age thirty-two the Bi-County single-year percentages are lower, and from age thirty-three through fifty-three higher than those reported for the nation and state. The Nassau-Suffolk share in the fifty-four and fifty-five year categories is above that recorded for the United States, but below that for New York State. In the age groups from fifty-six through 100 years or more the Region's percentages are below those of both the nation and New York.

The relative share of the Bi-County population in the 39 year and in each of the single-year groups or cohorts 41-47 years exceeds the proportion of the national population in those groups by more than 20.0%. No single year United States figures for ages 85 and over are available for comparison with Nassau-Suffolk; however, based upon figures for the five-year cohorts, for which information has been published, the County percentages average more than 25.0% lower than the national percentages for the five-year cohorts "85-89", "90-94" and "95-99".

In the United States, New York State, and Nassau-Suffolk, tenyear olds constituted the largest single-year cohorts in 1970 and twelve-year olds the second largest. In the nation and the state nine-year olds made up the third largest group, but in NassauSuffolk the eleven-year olds occupied the third position.

In 1970, in the country as a whole, 45.9% of the population was under 25 years of age; in the State of New York, 42.9%; and in Nassau-Suffolk, 46.0%.

Median age of the population was 28.1, 30.3, and 27.4 years in the United States, New York State and Nassau-Suffolk, respectively.

#### The Region: 1960 and 1970

A comparison of the age structure of the population in 1960 and 1970 as shown in Appendix II: Nassau and Suffolk Towns and Cities:

Age of the Population 1960 and 1970 furnishes evidence of some of the changes that have occurred during the past decade. Despite ten years of extraordinary growth, the 1970 Census reported fewer pre-school children and fewer adults aged 30-34 and 35-39 years. The 21,748 person, or 9.4% decrease in the number of children under five years suggests that an unusually sharp reduction in births to Nassau and Suffolk residents has more than offset the size of the pre-school group added to the Region's population as the result of in-migration. The somewhat smaller absolute but comparable relative decreases in the size of the 30-34 and 35-39 year groups merely reflect the aging of the "Depression" cohorts — those persons born during the 1930's when marriages were often postponed and the birth rate dropped sharply.

In the case of all three groups discussed above, the absolute losses recorded in Nassau were high enough to offset the small gains recorded in Suffolk. Nassau also reported a reduction in the size of the 5-9 year cohort, but the 21,301 person decrease in

the western county was more than offset by a 61,853 person increase in the eastern county, thus producing a regional increment of 40,552 persons, or 17.2%.

Census figures indicated gains in all other age categories. Absolute increases ranged from a low of 6,693 persons in the 85 years and over group to a high of 123,019 persons in the 15-19 year group. Relative changes ranged from a low of 17.2% (the 5-9 year olds) to over 100.0% (the 15-19,20-24, and 85 years and over). By the end of the decade, the Census counted 209,791 more school age children (5-19 years); 67,035 more 18-20 year olds; and 60,250 more senior citizens in Nassau and Suffolk than in 1960.

A review of Appendix Table III, Nassau and Suffolk Towns and Cities: Percent of the Population by Age Group 1960 and 1970 reveals significant shifts in proportion of the population in several of the eighteen age groups for which comparable 1960 and 1970 data is available. There appears to have been a sharp drop in the relative size of the youngest five year cohort, a modest drop in the second youngest cohort, a modest increase in the third (10-14 year) cohort, and a sharp increase in each of the two succeeding (15-19 and 20-24 year) cohorts. Little change occurred in the size of the share of the Region's population in the 25-29 year class, but there was a marked reduction in the percentage of Nassau and Suffolk residents listed as 30-34 and 35-39 years and a modest reduction in the percentage listed as 40-44 years. All but one among the nine older groups increased its share of the total; the 65-69 year group recorded a very slight decrease.

### The Counties - Age of the Population, 1970

Slightly more than five out of every nine Bi-County residents live in Nassau; the remaining four live in Suffolk. If the population in each of the age groups was so distributed as to reflect the county or community share of the total population, the age profile for each constituent part of the Nassau-Suffolk Region would be identical with that of the whole. Appendix Table III indicates that this is obviously not the case in the Bi-County area.

On the whole, the Nassau population whose median age was 30.9 years was older than that of Suffolk whose median age was 26.3 years in 1970. The western county reported a disproportionately high share of teenagers, and persons 40 years and over while the eastern county reported a disproportionately high share of young children and relatively young adults.

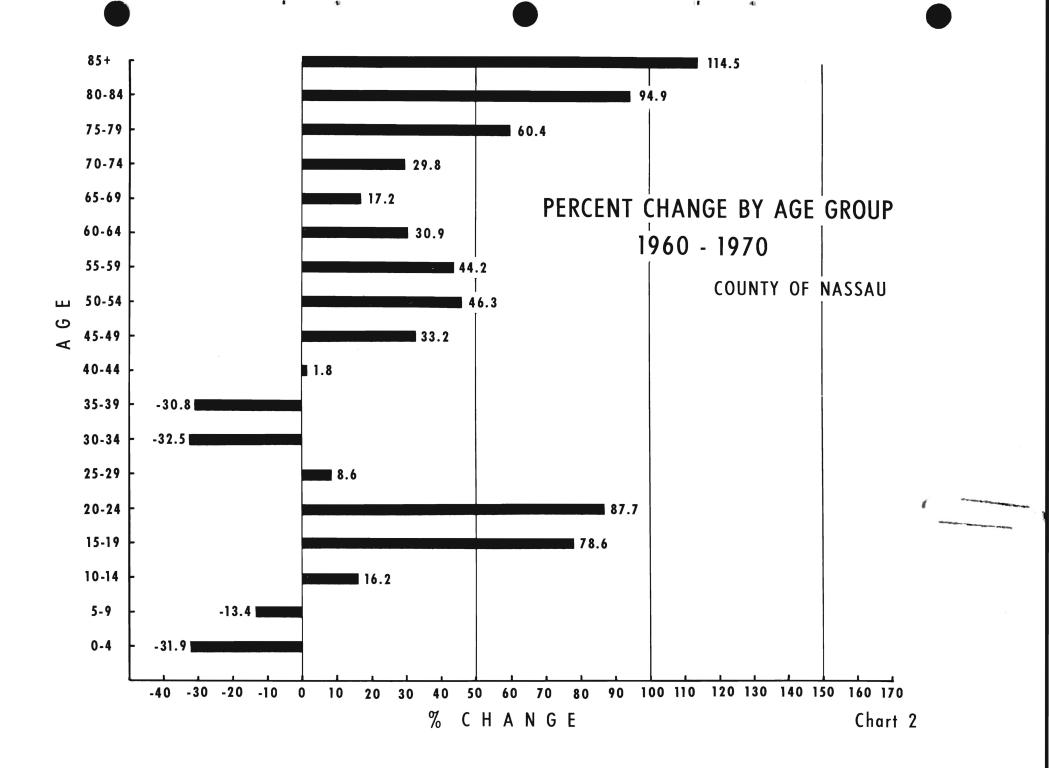

Nassau had 13,988 or 14.3% fewer pre-school (under 5 years) children than Suffolk and 1,126 or 0.8% fewer 5-9 year olds. In contrast, the more populous and somewhat more urbanized western county had far greater numbers in the 10-14, 15-19, and 20-24 year classes, exceeding the comparable Suffolk totals by 32,189 persons or 19.7%, 51,062 persons or 34.8%, and 23,317 persons or 26.2%, respectively. Suffolk, in turn, led in the count of residents aged 25-29 and 30-34 years, outnumbering their contemporaries in Nassau by 7,386 or 10.9% and 4,750 or 7.0% respectively. Starting with the 35-39 year cohort and continuing through the remainder of the age distribution, the Nassau count was consistently -- and not unexpectedly -- higher than that recorded for Suffolk, although in no instance was

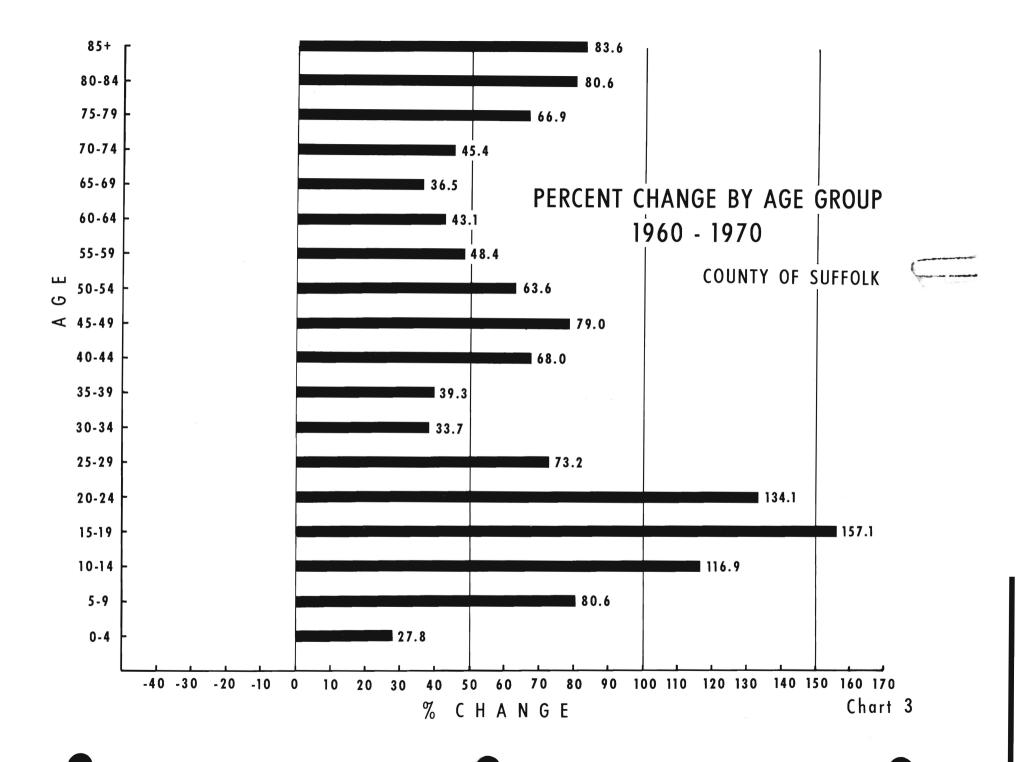

the difference in the size of the cohort as great as that noted in the 15-19 year group. Nassau claimed a disproportionately large share of the middle aged (40-64 years), especially persons in the cohorts 45-49 and 50-54 years. These Nassau residents, many of them the home buyers of the late 1940's and the 1950's outnumbered their Suffolk counterparts 45-49 and 50-54 years by 51,005 persons or 43.4% and 47,510 persons or 47.5% respectively. The Nassau senior citizen population also accounted for a larger than anticipated share of the Bi-County total, but both absolute and relative differences were of lesser magnitude than in the case of the above identified cohorts.

# The Counties: Changes in the Age Composition of the Population, 1960 - 1970

In Nassau the greatest absolute growth occurred in the 15-19 year cohort, which recorded a 64,576 person increase. The 20-24 year cohort was second with a 41,664 person gain and the 50-54 year cohort, third with a 31,635 person gain. As indicated on Chart 2, page 9, the greatest relative growth, 114.5 percent took place in the oldest group, which more than doubled in size. The 80-84 year group was second with a 94.9 percent gain; the 20-24 year and the 15-19 year cohorts were third and fourth, with 87.7 percent and 78.6 percent respectively.

In Suffolk the greatest absolute growth occurred in the 10-14 year cohort which recorded a 70,516 person increase. The 5-9 year cohort was second with a 61,853 person gain and the 15-19 year cohort was third with a 58,443 person gain. As shown on Chart 3, page 10, the greatest relative growth, 157.1 percent took place in the 15-19 year group, which by 1970 comprised more than one and one

half as many individuals as it had at the beginning of the decade. Two other groups more than doubled in size, the 20-24 year olds and the 10-14 year olds which recorded gains of 134.1 percent and 116.9 percent respectively.

Although changes in the proportion of the population in each of the eighteen age groups listed in Appendix Table III are evident in both counties the magnitude of the shifts appears to have been far greater in Nassau than in Suffolk. For example, the percentage of all residents in the pre-school group dropped by more than 3/8 in Nassau, but by not quite 1/4 in Suffolk. Similarly, the relative size of the 15-19 year cohort increased by about 5/8 in Nassau but by only a little over 1/2 in Suffolk; that of the 20-24 year class, by almost 4/5 in Nassau, but by just over 2/5 in Suffolk. The percentage of all persons in the 30-34 year group dropped by more than 3/8 in Nassau but by about 1/5 in Suffolk; that in the 85 year and over category nearly doubled in Nassau but rose by little more than 1/16 in Suffolk.

It seems probable that the more pronounced alterations in the age profile of the western county can be attributed for the most part to the normal aging of a suburban population that in recent years has been little affected by in-migration. To the extent that in-migration has occurred in Nassau County, it appears to have been more selective by age than in Suffolk and has tended to conform to and to reinforce rather than to modify the existing age structure as in Suffolk.

## The Region and the Counties: Variations in Age Structure Attributable to Sex or Race, 1970

In most areas the Census recorded notable variations in the age structure of the male and female and the white and Negro components of the population. The Nassau-Suffolk Region is no exception.

The variation in median age indicated in Table 2 below suggests that the female is consistently older than the male components of the population. Data for the male-female ratio by single year of age in the Region and the two counties is presented in Appendix Table IV, page 90.

Table 2 MEDIAN AGE BY SEX, THE UNITED STATES, THE BI-COUNTY REGION, AND THE COUNTIES:

Area	Medi Male	an Age Female	Difference (In Years)
United States	26.8	29.3	2.5
Bi-County Region	26.2	28.6	2.4
Nassau County	28.0	31.4	3.4
Suffolk County	24.4	26.1	1.7

Source: U. S. Census of Population, 1970

The Bi-County male-female ratio; that is, the number of males per each 100 females, generally conforms to the national pattern.

Both in the country as a whole and in the Region, males outnumbered females at all ages from under one year through eighteen.

In the United States females outnumbered males at all ages from 19 to 99 but in the Bi-County area the females outnumbered males in only 71 out of 80 single year cohorts. The census reported a preponderance of males in each of the groups aged 49,51,52,54 through 58 and 60 years. The admittedly overstated and therefore

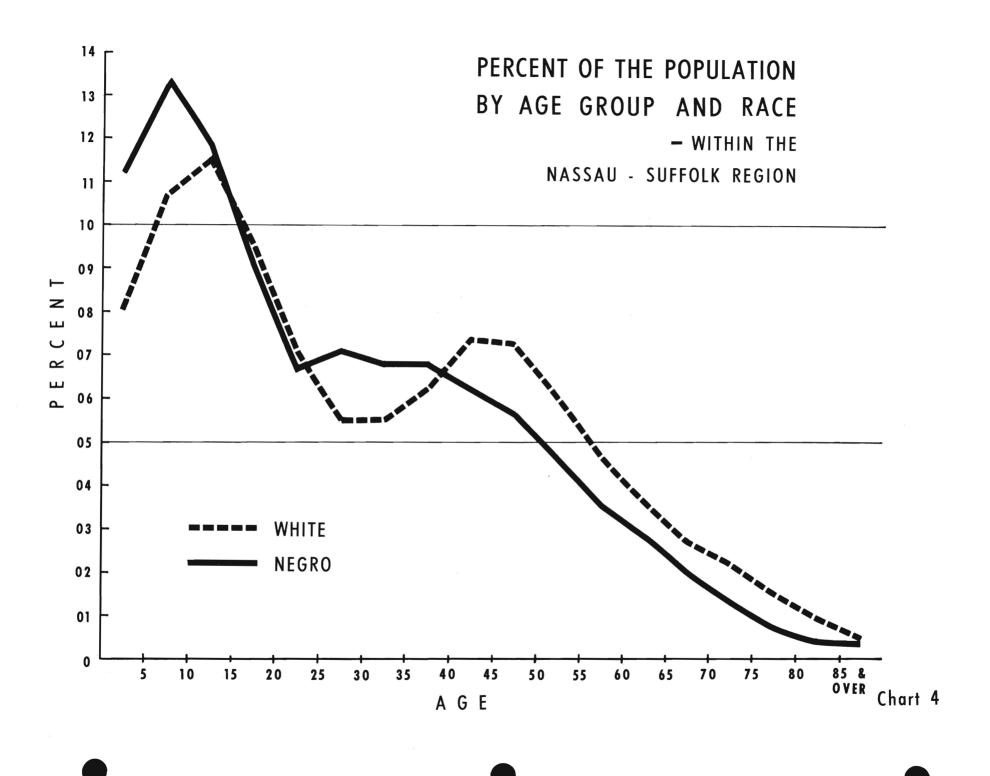

questionable totals for the 100 year and over class show a reversal of the general pattern with more males than females in both the nation and the Region.

The separate Nassau and Suffolk patterns of male-female ratios differ somewhat from that recorded for the Bi-County area and from one another. In both Nassau and Suffolk the number of males exceeded the number of females in more single year cohorts than in the Region as a whole. Nassau recorded more males than females in 31 cohorts; Suffolk, in 37 cohorts; and the Region, in 28 cohorts. Appendix Table IV indicates that although both counties reported more males than females in the youngest age groups — the ratio exceeded 1.001 for all years 0-17 in Nassau and 0-18 in Suffolk — the western county recorded a preponderance of males in twelve out of the fourteen single year classes commencing with age 49 and ending with age 62, while the eastern county recorded a similar prepondrance in all seventeen of the single year classes commencing with age 38 and ending with age 54.

Differences between the age structure of the white and Negro portions of the Nassau-Suffolk population are even more striking.

Chart 4, page 14, which presents a graphic comparison of the age profiles of the two races, reveals an extremely young configuration for the Negroes and a somewhat older one for the whites.

The curve for the white component of the population peaks at the 11.5 percent level between years ten and fourteen, drops sharply to a point between years 20 and 24, and then descends gradually to a point between years 30 and 34. The curve rises again to a second,

but lower peak, at a point between years 40 and 44 and then descends gradually to the 0.5 percent level at the older end of the age distribution.

At the same time the curve for the Negro component of the population peaks at the 13.3 percent level at a point between years five through nine, drops sharply to a point between years 20 and 24, ascends slightly and then descends steadily from a point between years 25 and 29 to the 0.3 percent level at the older end of the age distribution.

Table 3, below, offers additional evidence of the older age structure of the white population both in the nation and the Region.

Table 3 MEDIAN AGE BY RACE, THE UNITED STATES, THE BI-COUNTY REGION, AND THE COUNTIES

Area	Median White	Age <u>Negro</u>	Difference (in Years)
United States	28.9	22.4	6.5
Bi-County Region	28.9	23.4	5.5
Nassau County	31.4	24.1	7.3
Suffolk County	26.5	22.5	4.0

Source: U.S. Census of Population, 1970

Figures for the proportion of the population under 25 years provide further indication of the younger age structure of the Negro group. In the Region, only 45.8 percent of the whites but 52.1 percent of the Negroes were under 25 years in 1970; in Nassau 44.1 percent of the whites and 51.3 percent of the Negroes, and in Suffolk 48.0 percent of the whites and 53.0 percent of the Negroes were under 25 years at the last census date.

The extent of the disparity between the age profiles of whites and Negroes, while considerable in both counties is far greater in Nassau than in Suffolk. Table 4 page 16, indicate the greater range in the size of the white and Negro shares of their respective population in almost all age groups in the western county. The greater similarity in the age of the white and Negro populations in Suffolk is due, in large measure, to the presence of a relatively young white population in the eastern county.

Appendix Table V, Nassau and Suffolk Towns and Cities: Age of the White Population, 1970 and Appendix Table VI, Nassau and Suffolk Towns and Cities: Age of the Negro Population, 1970, pp. 92 & 96 which give the number of persons and share of the population in each of the eighteen age groups, permit a similar analysis of racially related differences in age composition in the major municipalities.

## The Towns and Cities - Age of The Population, 1970

In general, the absolute size and relative rank of each of the eighteen age groups in the major municipalities reflect the size of the municipality's share of the entire Nassau-Suffolk population. (see Table 5, pp. 17 and 18.)

Thus the Town of Hempstead, whose residents constituted the largest portion of the 1970 population both in Nassau and the Region, ranked first among all fifteen towns and cities in the number of persons recorded in each of the eighteen separate age groups for which data is presented in Appendix Table III.

The Town of Oyster Bay whose residents constituted the second

largest portion of the Bi-County population ranked second in eight of the eighteen classes; those 5-9,10-14,15-19,20-24,35-39,40-44,45-49 and 50-54 years; third in two classes: those 55-59 and 60-64 years.

The Town of Islip with the third highest number of inhabitants in the Region ranked second in number of persons aged 0-4,30-34,70-74,75-79, 80-84 and 85 years and over; third in number of persons age 5-9,10-14, 25-29,35-39,40-44 and 65-69 years.

The Town of Brookhaven, fourth in the Region in total number of persons, ranked second in number of residents aged 25-29 years and third in number of residents aged 0-4,20-24 and 30-34 years.

The Town of North Hempstead, fifth in total population in the Nassau-Suffolk area, ranked second in the count of inhabitants in the classes 55-59,60-64 and 65-69 years; third, in the classes 15-19, 45-49,50-54,70-74,75-79,80-84 and 85 years and over.

Table 6, page 20, indicates that when the town or city share of all persons in a given cohort is ranked according to size from largest to smallest, the relative position of 116 out of a possible 270 separate groups (61.5%) is identical with the relative position obtained from a ranking based upon the total number of persons of all ages in each of the fifteen jurisdictions. The relative position is similar; that is, no more than one place removed from the municipal rank for all persons in the case of an additional 63 groups (23.3%). In only 41 instances does the town or city share of a single age class appear significantly different from the prevailing pattern. Sixteen of the larger or smaller than expected groups are to be found in the Town of North Hempstead, eight in the Town of Oyster Bay, seven in the Town of Huntington, and the remaining ten in the Cities of Glen Cove and Long Beach and the Towns of Babylon, Brookhaven, and Southold.

Comparison of the median age of residents in each of the major municipalities offers some indication of the variations in the age structure of their respective populations. Median age ranges from a low of 23.80 years in the Town of Brookhaven to a high of 48.32 years in the Town of Shelter Island. Table 7, shows both median age and percent of the population under 25 years and relative rankings for towns and cities.

TABLE 7, NASSAU AND SUFFOLK TOWNS AND CITIES: MEDIAN AGE AND PER-CENT OF THE POPULATION UNDER 25 YEARS, 1970

		Age Ranking

Source: U.S. Census of Population, 1970

On the basis of median age Oyster Bay was the youngest municipality in Nassau, but only the sixth youngest in the Region.

It is hardly surprising that the Census reported the lowest town-wide median age in both Suffolk and the Region in the Town of Brookhaven, the most rapidly developing municipality and the one with a campus of the State University that has large numbers of

students in residence. It is interesting to note that in four out of the fifteen municipalities the median age was over 35 years and that the City of Long Beach, generally considered the haven of the elderly, reported a younger population than did either Southold or Shelter Island.

In 1970 slightly more than half of the residents of Brookhaven and nearly half of the residents of Babylon reported their age as under twenty-five years. A somewhat smaller proportion -- between 40.1% and 48.7% -- listed themselves as under twenty-five years in nine municipalities. In the City of Long Beach and the towns of East Hampton, Shelter Island, and Southold, less than 37.4% of the inhabitants stated their age as under twenty-five years. The ranking, from largest to smallest proportion of the population under twenty-five generally follows the same pattern as that shown for median age. The few minor variations in position appear to be of little significance since they are based upon differences of no more than one or two percentage points.

# Towns and Cities: Changes in the Number of Persons, 1960 - 1970 Selected Age Groups

Tabulations for six age groups for which such data is most frequently requested -- the under 5 years, 5-17, 18-20, 21-59, 60-64 and 65 and over -- are presented in Appendix Table VIII, p. 106. These tabulations indicate that the Census counted fewer preschool children in 1970 than in 1960 in nine out of the fifteen major municipalities. Only in the City of Long Beach in Nassau and in the towns of Brookhaven, Huntington, Islip, Shelter Island, and Smithtown in Suffolk were there greater numbers in the youngest

age at the end of the decade. The increase in Long Beach involved a gain of only 80 persons; that in Huntington, 693 persons; and that in Shelter Island, 8 persons. The major increases and those with the greatest potential impact occurred in Brookhaven where a ten year gain of 13,858 nearly doubled the number of pre-schoolers, in Islip where the addition of 6,314 children raised the under five count by 28.1%, and in Smithtown where a 5,114 person increment resulted in a 76.1% increase in the size of the youngest cohort.

With the exception of Shelter Island, all towns and cities reported gains in the number of inhabitants aged five through seventeen years. Table <sup>8</sup>, indicates extraordinary increases in the school age population of the five western towns in Suffolk and somewhat smaller but sizeable increases in that population in the towns of Hempstead and Oyster Bay in Nassau.

The list of additions to the elementary and secondary school population provides a somewhat different picture when considered in terms of relative rather than absolute growth. Table 9, lists the major municipalities according to the magnitude of the relative change in the size of their 5-17 year populations.

TABLE 9
RANKING OF NASSAU AND SUFFOLK TOWNS AND CITIES ACCORDING TO THE RELATIVE GROWTH OF THE SCHOOL AGE POPULATION, 1960 - 1970

Ranking	Town or City	Percent Increase

12	Long Beach	14.1
13	Hempstead	8.5
14	North Hempstead	2.2

Source: U. S. Census of Population, 1960 & 1970

All major municipalities, including Shelter Island reported gains in the number of inhabitants aged 18-20 years. This group, which is currently the object of increasing attention on the part of educators, youth workers, politicians, and businessmen, listed absolute gains in the amount of 37,654 persons in Nassau; 29,381 persons in Suffolk. Four towns -- Hempstead with an additional 20,615 persons, Oyster Bay with 11,272, Brookhaven with 8,756, and Islip with 6,286 -- accounted for more than 7/10 of all Bi-County growth in the 18-20 year class.

It is likely that a significant portion of the gains which resulted in a four-fold increase in the number of 18-20 year olds can be

attributed to the presence of the State University campus. In nine of the thirteen towns, the group more than doubled in size between 1960 and 1970; in one it doubled. In the remaining three towns and the two cities relative increases ranged from 56.5% to 81.2%.

The largest age group with respect to the span of years covered, the 21-59 year olds, added more persons than any of the other five groups in eleven of the Region's towns and cities. The cities of Glen Cove and Long Beach and the towns of Shelter Island and Southold provided the exceptions to the rule. Table 10 shows the relative position of the major municipalities based upon the magnitude of the absolute changes recorded for the period 1960-1970.

TABLE 10
RANKING OF NASSAU AND SUFFOLK TOWNS AND CITIES ACCORDING TO THE NUMBER OF PERSONS ADDED TO THE 21-59 YEAR AGE GROUP

		Change in No. of

14	Glen Cove	700
15	Shelter Island	85

Source: U.S. Census of Population, 1960 & 1970

Analysis of the figures in the right hand column of Table 10 reveals that the three top ranked towns -- all in Suffolk -- accounted

for well over half of the Regional increment reported for the age group. Together with the fourth and fifth ranked towns, also in Suffolk, they accounted for more than three-fourths of the total growth in the 21-59 year class.

Relative gains are less impressive because of the effect of an extremely large base (1960) population. Percent increases ranged from a low of 5.3% in North Hempstead to a high of 116.1% in Brookhaven. Islip, with the second largest absolute increase, recorded a relative change of 53.9%, while Huntington and Smithtown with the third and fourth largest absolute gains recorded percent changes of 52.2% and 107.2%, respectively.

The relatively small 60-64 year class increased in numbers in each of the fifteen towns and cities. Gains ranged from a high of 6,613 persons in the Town of Hempstead to a low of 88 persons in the Town of Shelter Island. Table 11 shows the relative position of the major municipalities based upon the magnitude of the absolute changes recorded for the period 1960 - 1970.

TABLE 11
RANKING OF NASSAU AND SUFFOLK TOWNS AND CITIES ACCORDING TO THE NUMBER OF PERSONS ADDED TO THE POPULATION AGED 60-64 YEARS, 1960 & 1970

		Change in the			Change in the

7	Islip	1,430	15	Shelter Island	l 88
8	Southampton	927			

Source: U. S. Census of Popuation, 1960 & 1970

Brookhaven and the five eastern Suffolk towns recorded the greatest relative growth -- in excess of 60.0% in all cases and in excess of 100.0% in Riverhead and Shelter Island. In the Nassau towns and cities and in the four western Suffolk towns (Babylon, Huntington, Islip, and Smithtown) relative gains ranged from 20.3% to 43.4%.

In 1970 the Census reported a 60,250 person increase in the number of Nassau and Suffolk inhabitants aged sixty-five years or older -- approximately seven senior citizens for every five who were counted in the Region in 1960.

Table 12 indicates that four out of fifteen major municipalities added more than 5,000 elderly residents during the ten-year period and one, the Town of Hempstead, added more than three times that number. The Town of Hempstead together with the towns of Brookhaven, Oyster Bay, and North Hempstead accounted for 54.1% of the growth in the 65 years and over group.

TABLE 12
RANKING OF NASSAU AND SUFFOLK TOWNS AND CITIES ACCORDING TO THE NUMBER OF PERSONS ADDED TO THE POPULATION AGED 65 YEARS AND OVER

		Change in the Number of
Ranking	Town or City	Persons 65 Years and Over

12	Riverhead	1,091
13	Glen Cove	591
14	East Hampton	567
15	Shelter Island	146

Source: U. S. Census of Population 1960 & 1970

In Nassau absolute increases in the total number of elderly persons was only slightly higher than in Suffolk. Were it not for the sharp reductions in the count of elderly patients at Pilgrim State and Central State Hospitals -- a ten-year drop of 1,271 persons -- additions to the senior citizen group would have been greater in Suffolk than in Nassau and Islip would have occupied fifth rather than sixth place in the ranking.

Relative gains ranged from a low of 25.8% in the Town of Islip to a high of 190.0% in East Hampton. Six out of fifteen towns and cities reported gains equivalent to less than 50.0% of their 1960 senior citizen population; six, gains equivalent to 50.0 to 75.0%; one, a gain equivalent to 75.0 to 100.0%; and two, gains equivalent to more than 100.0%.

Minor Civil Divisions and Places: Age of the Population, 1970

There is considerable variation among the census reporting areas

(incorporated villages or portions thereof whenever a village is

bisected by a town line and unincorporated places) as to geographic

extent and population density. This heterogeneity makes brief comparative description at best, somewhat difficult to understand; at

worst, meaningless. Inasmuch as most persons consulting Appendix

Table VIII, Minor Civil Division and Place: Age of the population

by Selected Age Group 1960 - 1970, will probably do so to obtain

data about their own or adjacent communities only a few of the high
lights are indicated below.

Thirty-six out of 142 census reporting areas in Nassau and 37 out of 199 in Suffolk counted 1,000 or more residents under five years of age. Levittown with 5,694 led all other Nassau and Suffolk communities while Central Islip with 4,166 led all Suffolk areas

in number of pre-school children.

Thirty areas in the western county and 14 in the eastern county reported a 5-17 year population in excess of 5,000 persons. Levittown with 21,383 school age children again ranked first in Nassau and the Region, while Central Islip with 12,298 ranked first in Suffolk and fourth in the Region.

Twenty-five communities in Nassau and six in Suffolk listed more than 1,000 18-20 year olds among their inhabitants. Levittown with 3,378 was first in Nassau but second in the Region, While South Stony Brook with 3,702 was first in Suffolk County and the Region.

Forty-six Nassau and 31 Suffolk communities counted more than 5,000 residents aged 21-59 years. Levittown with 31,341 young and middle aged adults led all others in Nassau and the Bi-County area; North Babylon with 18,733 led all other Suffolk communities and ranked seventh in the Region.

Eighteen areas in Nassau and one in Suffolk reported more than 1,000 inhabitants aged 60-64 years. The City of Long Beach with 2,109 persons in the pre-retirement or early retirement group ranked first in Nassau and the Region. Pilgrim State Hospital with 1,094 such persons ranked first in Suffolk but only fifteenth in the Region.

Thirty-six Nassau and 47 Suffolk communities listed more than 1,000 senior citizens among their residents. The City of Long Beach with 6,942 persons aged 65 years and over led all other cities, villages, and unincorporated places in Nassau and the Region. Central Islip State Hospital with 2,835 elderly persons ranked first in Suffolk and ninth in the Region. Map 3, p.161 shows the distribution of persons 65 years and over by minor civil division and place.

Table 13 lists the five leading Nassau and Suffolk Communities based upon the number of persons in each of the six age categories, in 1970.

# Minor Civil Divisions and Places: Changes in the Age Composition of the Population, 1960 - 1970

Analysis of the age breakdown for minor civil divisions and places presented in Appendix Table VIII reveals that only 27 out of a possible 142 census reporting areas in Nassau County recorded any increase in the size of the youngest (under five years) age group while 111, more than three and one-half as many recorded decreases. One of the four remaining areas experienced no change; figures were unavailable for the other three.

Gains were generally small, falling within a narrow range from as few as two persons (the Village of Plandome Manor) to as many as 213 persons (the Village of Hempstead).

Table 14 lists the ten Nassau communities with the largest growth in their pre-school population.

TABLE 14

Source: U. S. Census of Population, 1960 & 1970

It is interesting to note that only six Nassau communities reported additions to their pre-school population amounting to 100 persons or more. Where gains occurred the pre-school increment usually

constituted a small fraction of the total growth.

Losses were generally of greater magnitude and covered a far broader range, involving as few as two and as many as 4,401 children (Off Shore Islands and Levittown, respectively). Table 15 lists the ten communities with the greatest decreases in their pre-school population.

TABLE 15
THE TEN NASSAU COMMUNITIES WITH THE GREATEST DECREASE IN THE NUMBER
OF PERSONS UNDER FIVE YEARS OF AGE, 1960 - 1970

Rank	Community	Amount of Decrease	Percent Change
1	Levittown	4,401	-43.6
2	Hicksville	3,477	-53.0
3	East Meadow	3,141	-51.0

9	Franklin Square	1,242	-41.4
10	South Farmingdale	1,229	-43.6

Source: U. S. Census of Population, 1960 & 1970

In addition to the ten communities listed in Table 15, North Wantagh, South Westbury, and Locust Grove each experienced a loss of more than 1,000 persons of pre-school age. As a rule, increases in the number of persons in other age groups tended to offset decreases in the youngest class. However, the combination of sizeable reductions in the number of both pre-school and school age residents resulted in net losses in Hicksville, Franklin Square, North Wantagh, and South Westbury and a minimal net gain in East Meadow.

In Nassau, gains were few, relatively insignificant, and occurred in most instances in the incorporated villages. Losses were many, often large, likely to have a considerable impact upon affected school systems, and in the case of the larger decreases occurred

most frequently in the unincorporated portions of the Towns of Hempstead and Oyster Bay.

In Suffolk 102 out of a possible 199 or more than half of all census reporting areas, recorded increases in the number of residents under five years of age.

Ten communities, those listed in Table 16, each added more than 1,000 pre-school children during the period 1960-1970, while another 16 communities each added between 500 and 999 pre-school children.

TABLE 16

THE TEN SUFFOLK COMMUNITIES WITH THE GREATEST INCREASE IN THE NUMBER OF PERSONS UNDER FIVE YEARS OF AGE, 1960-1970

9	Wyandanch	1,046	112.7
10	East Half Hollow Hills	1,041	905.2

Source: U. S. Census of Population, 1960 & 1970

Additions to the pre-school component of the population appear to have accounted for a somewhat larger share of total community growth in Suffolk than in Nassau.

Losses, although numerous and widely distributed, were generally smaller and less significant. They vary in size from a decrease of one in Jamesport to a decrease of 757 in North Babylon. Table 17 lists the ten Suffolk communities that experienced the greatest reductions in their pre-school population.

TABLE 17
THE TEN SUFFOLK COMMUNITIES WITH THE GREATEST DECREASE IN THE NUMBER OF PERSONS UNDER FIVE YEARS OF AGE, 1960 - 1970

10	North Lindenhurst	287	-21.5

Source: U. S. Census of Population, 1960 & 1970

Four additional communities: East Farmingdale, the Village of Lindenhurst, Huntington, and Kings Park also sustained losses in excess of 200 persons in the under five year group. It is interesting to note that of the fourteen areas identified above, five were located in the Town of Babylon; four in the Town of Huntington; three in the Town of Islip; and one each in the towns of Brookhaven and Smithtown.

In Suffolk gains outnumbered losses and were often of major significance in terms of potential impact upon local school systems.

The greatest increases occurred for the most part, in the same rapidly developing central corridor communities that experienced the greatest total population growth. Losses, with the possible exception of those listed above, appear unlikely to have a substantial impact upon local school systems.

Decreases tend to be more widely distributed throughout Suffolk County and were particularly numerous, if not especially large, in the five eastern towns.

In Nassau, more than three times as many census reporting areas listed increases in the number of school age residents as in the number of persons under five years. Eighty-seven recorded increases; 51 recorded decreases; and one, no change. In three areas there was no information available. Nineteen communities, twelve in the Town of Hempstead and seven in the Town of Oyster Bay counted over 1,000 more school children in 1970 than in 1960. Table 18 shows the ten Nassau communities with the greatest growth in their school age population. Gains ranged from as little as the addition of a single child in South Floral Park to as much as the addition of 2,668 children in Plainview.

TABLE 18
THE TEN NASSAU COMMUNITIES WITH THE GREATEST INCREASE IN THE NUM-BER OF PERSONS AGED 5-17 YEARS, 1960 - 1970

Rank	Community	Amount of Increase	Percent Change

10	Jericho	1.504	46.5

Source: U. S. Census of Population, 1960 & 1970

With the exception of the Village of Hempstead, which reported a small gain, none of the above listed communities recorded any growth in their pre-school population. One, Plainview, experienced a sharp drop in the number of residents under five years of age (See Table 15, p. 33).

In contrast to the pattern in the youngest category, community

decreases in the school age component of the population were generally of lesser magnitude than comparable increases. Losses ranged in size from that in Glen Head, a decrease of only two persons, to that in Franklin Square, a decrease of 1,543 persons.

Losses numbered more than 1,000 persons in only three out of 53 census reporting areas. Table 19 lists the ten communities with the greatest reduction in the size of the age group 5-17 years.

TABLE 19
THE TEN NASSAU COMMUNITIES WITH THE GREATEST DECREASE IN THE NUMBER OF PERSONS AGED 5-17 YEARS, 1960 - 1970

9	Garden City Park	487	-19.9
10	West Hempstead	465	- 8.3

Source: U. S. Census of Population, 1960 and 1970

Of the ten Nassau communities that recorded the largest decreases in school age population, seven are located in the Town of Hempstead; two in the Town of North Hempstead; and one, in the Town of Oyster Bay.

In Suffolk, approximately one and three fourth times as many census reporting areas listed increases in the number of school age residents as in the number of persons under five years. One hundred seventy-four recorded increases; 23 recorded decreases, and information is not available in two areas.

Forty-four communities -- six each in the Towns of Babylon,

Huntington, and Smithtown; twelve in the Town of Islip and fourteen in the Town of Brookhaven counted over 1,000 more school children in 1970 than in 1960. Elsewhere, except in a few East End or barrier beach communities -- Hampton Bays Beach added only five persons to its school age population -- growth was substantial, averaging several hundred persons per reporting area.

Table 20 lists the ten Suffolk communities with the greatest absolute increase in the number of residents aged 5-17 years. Comparison of this table with Table 19, p. 37, provides a rough measure of the differing magnitude of the burdens that population growth during the past ten years placed upon Nassau and Suffolk school administrations and taxpayers.

TABLE 20
THE TEN SUFFOLK COMMUNITIES WITH THE GREATEST INCREASE IN THE NUM-BER OF PERSONS AGED 5-17 YEARS, 1960 - 1970

Rank	Community	Amount of Increase	Percent Change

10	North Centereach	3,494	2,911.7

Source: U. S. Census of Population, 1960 and 1970

It is interesting to note that four of the communities listed above -- Central Islip, East Half Hollow Hills, West Smithtown, and North Centereach -- also appear among those reporting the greatest increases in the number of pre-school children (See Table 16, p.34).

Losses were few and generally of little or no consequence.

Decreases ranged from a two person reduction in the school age population in one barrier beach and four East End areas to a 206 person reduction in East Farmingdale.

In more than half of the 21 cases, the losses involved fewer than ten children. The ten communities that experienced somewhat greater losses are listed in Table 21.

<sup>\*</sup> Derived from incomplete data as published by the Census Bureau. The corrected age breakdown is not yet available.

Source: U. S. Census of Population, 1960 and 1970

Reduced inmate and staff population at two state mental hospitals, deactivation of the Suffolk Air Force Base, and census error account for the smaller number of school age residents in four of the areas listed. General population losses affecting most if not all age groups would seem to account for the others.

Most Bi-County communities, including those that experienced relatively slow overall population growth, recorded sizeable increases in the number of persons aged 5-17 years.

As a rule, the increases in the size of the school age component

were smaller, but accounted a greater share of net population change in Nassau than in Suffolk. In the western county a 1960 population comprising large numbers of pre-school and elementary school children and young homeowners became within ten years a population comprising large numbers of elementary and secondary school children and older homeowners. As previously indicated, inmigration did little to alter the existing age structure in Nassau during the last decade. In the eastern county, the 1960-1970 inmigration of younger households resulted in rapid growth in the number of persons of all ages with the largest increases recorded in the size of the pre-school and young homeowner, as well as the school age components of the population.

In Nassau, gains in the number of residents eighteen to twenty years of age were commonplace. Of the 142 census reporting areas, 134 recorded increases of from one to 2,254 persons; two listed no change; three, minor decreases of from six to 22 persons; and three, no data available. Table 22 lists the ten communities with the greatest numerical change.

TABLE 22

Source: U. S. Census of Population 1960 and 1970

It is interesting to note that seven of the above communities also appear among the ten with the greatest decrease in the number of persons under five years (See Table 15, p. 33). Two of the remaining three, the Village of Brookville and East Garden City, owe almost all of their substantial growth in the 18-20 year category to the establishment or expansion of educational institutions with residential facilities. The third, the Village of Garden City, owes at least a part of its growth to the similar but somewhat less rapid expansion of an existing university.

In Suffolk gains were the rule in 180 out of the 199 census reporting areas; losses, in 15; and no change, in two. Data was unavailable for two areas. Increases ranged from one to 3,692 persons; decreases from one to 341 persons. Table 23 lists the ten communities with the greatest numerical change.

TABLE 23

10	East Commack	522	1,160.0

Source: U. S. Census of Population, 1960 and 1970

Five communities listed above also appear among those recording the largest increases in the number of school age residents (See Table 20, p. 38). Three -- South Stony Brook, Shinnecock Hills, and West

Melville -- owe their extraordinarily large gains to the growth of educational institutions within their boundaries.

Losses, in the few areas in which they occurred, were either extremely small or in the case of East Farmingdale, the Suffolk Air Force Base, or the Pilgrim State Hospital could be attributed to the same factors that produced a sharp drop in the number of persons of all ages.

In Nassau 89 census reporting areas recorded increases in the number of inhabitants aged twenty-one through fifty-nine years and fifty recorded decreases. Data was not available for three areas. Gains involved as few as three persons (Elmont) and as many as 3,251 (Merrick). Table 24 lists the ten Nassau Communities with the greatest growth in their combined young adult and middle-aged population.

TABLE 24
THE TEN NASSAU COMMUNITIES WITH THE GREATEST INCREASE IN THE NUMBER OF PERSONS AGED 21-59 YEARS, 1960 - 1970

In most communities, changes in the size of the 21-59 year group show a close correlation with changes in the total population. The first seven communities listed in Table 24 are among the ten Nassau

areas with the greatest increase in the number of persons of all ages. Those listed in eighth, ninth, and tenth places rank thirteenth, twelfth, and fourteenth, respectively, in total population growth.

There is also an obvious relationship between gains in the 21-59 year and additions to the pre-school and school age categories. Thus, eight of the ten communities shown in Table 24 also appear in Table 18, p. 36, while a ninth, appears in Table 14, p. 32.

Losses were generally smaller than gains and involved as few as two persons (Hewlett Bay Park and Russell Gardens) and as many as 1,248 (Inwood). Table 25 lists the ten Nassau communities with the greatest reduction in the young adult and middle-aged component of their population.

TABLE 25
THE TEN NASSAU COMMUNITIES WITH THE GREATEST DECREASE IN THE NUMBER OF PERSONS AGED 21-59 YEARS, 1960 - 1970

Source: U. S. Census of Population 1960 & 1970

All of the above communities, with the exception of Port Washington, sustained losses in the number of residents of all ages and all but Port Washington and Bellerose Terrace were among the ten Nassau areas with the greatest decrease in total population.

In Suffolk 172 census reporting areas recorded increases in the number of inhabitants aged twenty-one through fifty-nine years and 25 recorded decreases. Data was not available for two areas. Gains involved as few as five persons (Montauk) and as many as 8,741 (Central Islip). Table 26 lists the ten Suffolk communities with the greatest growth in their combined young adult and middle-aged population.

TABLE 26
THE TEN SUFFOLK COMMUNITIES WITH THE GREATEST INCREASE IN THE NUMBER OF PERSONS 21-59 YEARS, 1960 - 1970

Source: U. S. Census of Population, 1960 and 1970

In Suffolk as in Nassau, there appears to be a significant correlation between change in the size of the 21-59 year group and change in total number of persons reported in the community. The first eight areas listed above were among the ten Suffolk areas with the greatest increase in the number of persons of all ages. The ninth and tenth ranked communities placed eleventh and fourteenth, respectively, in total population growth. All ten of the communities with the largest 21-59 year increment were among those with the greatest gains in either their pre-school or school age population. Three areas: Central Islip, North Centereach, and West Smithtown, were among the top group in both categories.

Decreases in the young adult and middle-aged components of the population normally followed the same pattern as that observed for persons of all ages; that is, sharp reductions in the size of the three state hospitals and the Suffolk Air Force Base communities, smaller reductions in East Farmingdale, Greenport Village, South Yaphank, and East Hampton Village; and apparent reductions — based upon incorrect or incomplete data — in the Northport Veterans Hospital and the Flowerfield areas. Losses were generally smaller than gains and ranged from a one person decrease in East Marion to a 3,206 person decrease at the Pilgrim State Hospital.

Twenty-four communities in Nassau and 65 in Suffolk recorded increases of 1,000 or more persons in the 21-59 year group. As a rule, additions to the young adult and middle-aged component of the population accounted for between a little less than two-fifths and a little more than one-half of all population gains.

As might be expected, changes in the pre-retirement or early retirement cohort — those residents aged 60-64 years — involved relatively small numbers of persons. In Nassau, 123 census reporting areas listed gains ranging from a three person increment in North Hills to a 669 person increment in Franklin Square.

Table 27 lists the ten Nassau Communities with the greatest increase in the 60-64 year group.

TABLE 27
THE TEN NASSAU COMMUNITIES WITH THE GREATEST INCREASE IN THE NUMBER OF PERSONS AGED 60-64 YEARS, 1960 - 1970

10	Lynbrook V.	2	97	28.0

Source: U. S. Census of Population, 1960 and 1970

With the exception of the City of Long Beach and North New Hyde Park, all of the above communities are located within the Town of Hempstead.

Sixteen census reporting areas recorded losses ranging from a reduction of one in the count for the Off Shore islands to a decrease of 123 in Bellerose Terrace. The latter figure is questionable inasmuch as it is based upon uncorrected printed figures for the community and is subject to revision. The next largest decrease, that in East Garden City, involved only 54 persons. One community reported no change from 1960 to 1970 and information was lacking for three others.

In Suffolk, 180 census reporting areas listed gains in the preretirement and early retirement cohort and 16 listed losses. Information was unavailable for three areas. Increases were somewhat smaller than in Nassau; decreases somewhat larger. Gains involved as few as three persons (the Village of East Hampton, Montauk, and the Shinnecock Indian Reservation) and as many as 299

persons (the Village of Lindenhurst). Table 28 lists the ten Suffolk communities with the greatest increase in the 60-64 year group.

TABLE 28

Source: U. S. Census of Population, 1960 and 1970

Unlike the Nassau communities with the largest additions to the 60-64 year group, all of which were slow-growing old established areas, the Suffolk communities constitute a mix of slow-growing older and rapidly expanding newer settlements. Four of the Suffolk communities are located in the Town of Babylon; three in the Town of Islip, and one each in the Towns of Huntington, Brookhaven, and Riverhead.

Sixteen census reporting areas recorded decreases of from one to 502 persons (Central Islip State Hospital); two listed no change; and data was not available for three areas. Four areas: the three state hospitals, and the veterans hospital, each reported a sizeable reduction in the number of persons 60-64 years of age. The figures for the Northport Veterans Hospital, as indicated earlier, are subject to revision. Elsewhere the losses were widely dis-

tributed, extremely small, and of little consequence.

Nearly all Bi-County communities counted more senior citizens in 1970 than in 1960. In Nassau, 126 census reporting areas recorded increases in the number of residents aged 65 years or more. Ten listed fewer elderly residents; three, no change; and three, data not available. Increments ranged from a one person gain in South Floral Park to a 3,812 person gain in the City of Long Beach.

Table 29 lists the ten Nassau areas with the largest additions to the oldest component of the population.

TABLE 29
THE TEN NASSAU COMMUNITIES WITH THE GREATEST INCREASE IN THE NUMBER OF PERSONS, AGED 65 YEARS OR OVER, 1960 - 1970

Source: U. S. Census of Population, 1960 and 1970

Eleven additional communities recorded increases of 500 or more persons 65 years or over and together with the ten listed above accounted for a gain of 17,561 senior citizens or 56.0% of the total 1960-1970 county-wide growth in the oldest category. Fourteen of the 21 communities that experienced the largest rise in the number of elderly residents are in the Town of Hempstead and three each are in the towns of North Hempstead and Oyster Bay. The City of Long Beach, which gained the greatest number of elderly people

and more than doubled its 1960 senior citizen population, is the other.

Increases in the 65 year and over component provided a significant part of the total population growth in many Nassau communities where additions to the oldest group often offset losses in one or more of the youngest age groups. Losses in the 65 year and over category were extremely small ranging from a decrease of one on the Off Shore islands to a decrease of 136 in Bellerose Terrace. In six of the ten communities reporting fewer senior citizens in 1970 than in 1960 reductions were minimal, involving 20 persons or less.

In Suffolk, gains were smaller and losses - in the case of the hospital area -- larger. One hundred eighty-two census reporting areas recorded increases and 15 recorded decreases. Data was unavailable for two communities. The increments ranged in size from a three person addition to the elderly population in the Village of Poquott to a 909 person addition in North Babylon. Table 30 lists the ten Suffolk communities with the largest gains in the oldest group.

TABLE 30
THE TEN SUFFOLK COMMUNITIES WITH THE GREATEST INCREASE IN THE NUM-BER OF PERSONS, AGED 65 YEARS OR OVER, 1960 - 1970

Rank	Community	Amount of Increase	Percent Change
1	North Babylon	909	73.8
2	Deer Park	769	61.3
3 ,	Lindenhurst	685	47.6
4	Central Islip	628	65.8
5	Brentwood	595	96.9
6	West Babylon	531	110.9
7	Huntington Station	491	31.5
8	Hauppauge	477	187.8
9	Copiague	466	53.9
10	East Commack	451	385.5

Source: U. S. Census of Population, 1960 and 1970

Only six Suffolk communities -- four in the Town of Babylon and two in the Town of Islip -- recorded gains of 500 or more persons. Unlike most Nassau communities where the rate of growth of the oldest component exceeded that of the population as a whole, most Suffolk communities experienced slower growth in the senior citizen group than in the population as a whole.

Losses, with the exception of those reported for the State and Veterans Hospital areas and for Flowerfield, were minimal, generally involving from one to a dozen persons.

# CENSUS TRACTS

In view of the previous, somewhat lengthy treatment of the age composition of the population by Minor Civil Division and Place and of the similarities between Minor Civil Division and Place data and the census tract figures, the following analysis is limited to a discussion of the median age of the population and the pre-school and senior citizen components of the population in the 457 Bi-County census tracts.

## Median Age of the Population

# The Region, 1970

Between 1960 and 1970 the median age of the population increased in 125, decreased in 204, and remained the same in one of the original 330 Bi-County census tracts. The median age rose sharply — by five years or more — in only 13 tracts; and dropped by a comparable amount in 34 tracts. Of the 13 tracts with a considerably higher median age in 1970, ten were located in Nassau and three were in Suffolk. Of the 34 with a considerably lower median age in 1970, thirteen were located in Nassau and 21 were in Suffolk.

The distribution of median ages as shown on Map 2, suggests that, in general, the older residents are concentrated at both geographic extremes of the Region; that is, in western Nassau and in Suffolk east of Riverhead. The youngest residents are most numerous in the recently developed communities and in areas with significant minority populations. There is an almost unbroken pattern of census tracts with a lower than average median age extending from Levittown on the west to Selden on the east.

## Nassau County, 1970

In 1970 the median age of the population in each of the 251 Nassau County census tracts ranged from a low of 18.92 years in tract 4073.01 in the Town of Hempstead to a high of 49.33 years in tract 4166 in the City of Long Beach. Both tract 4073.01, which encompasses the Hofstra University campus, and tract 4166, which includes a considerable number of senior citizen hotels and residences, are somewhat atypical. Only four Nassau tracts or 1.6 percent of the total number reported a median age of less than twenty years. Of these, three contained a college or university with residential facilities. Only eight or 3.2 percent reported a median age of forty years or more. Three of the tracts with a high median age comprise the portion of the City of Long Beach that has attracted and continues to attract increasing numbers of elderly persons; three comprise the Villages of Great Neck Plaza and most of the unincorporated community of North New Hyde Park in the Town of North Hempstead; and two include parts of the unincorporated community of Franklin Square and of the Village of Garden City in the Town of Hempstead.

Table 31 shows the total number of tracts in each of the Nassau towns and cities and the municipality's share of all tracts in each of four median age categories "under twenty-five years", "twenty-five through twenty-nine years", "thirty through thirty-four years", and "thirty-five or more years".

Thirty-seven of the 251 tracts constituted the first group — those with a median age of less than twenty-five years; 87 constituted the second group; 73, the third; and 54, the fourth. The Town of Hempstead was well represented in all four categories while North Hempstead was greatly under represented in the two younger categories and greatly over represented in the older categories. Oyster Bay, in contrast, was markedly overrepresented in the two younger categories and underrepresented in the older categories.

In 1960 the median age of the population in the 220 tracts into which Nassau was divided ranged from a low of 18.92 years in tract 5215 in the Town of Oyster Bay to a high of 45.60 years in tract 4166 in the City of Long Beach. Although the figure for the lowest median age for any tract was identical in 1960 and in 1970 the tracts in question were quite different. In 1960, tract 5215 in Massapequa Park was a part of a relatively new community of single family houses with a substantial juvenile population, whereas in 1970 tract 4073.01 in the Mitchel Field area included the recently expanded facilities of Hofstra University. The same tract, 4166 reported the oldest median age at both census dates; however, the median age increased by 3.73 years between 1960 and 1970.

TABLE 31
NASSAU TOWNS AND CITIES: SHARE OF NASSAU TRACTS BY MEDIAN AGE CATEGORY, 1970

	No. of monato	Percent of All	Percent of	Tracts	With Medi	an Age

Total	251	100.0	100.0	100.0	100.0	100.0

Source: U. S. Census of Population, 1970

Four tracts, 1.8 percent of the Nassau total, had a population whose median age was less than twenty years and seven tracts, 3.2 percent, had a population whose median age was over forty. Unlike the youngest tracts in 1970, the four 1960 tracts with a median age under twenty contained large numbers of single family residences and no major educational institutions. The "oldest" tracts comprised part of the City of Long Beach, the villages of Great Neck Plaza and Munsey Park in the Town of North Hempstead and portions of the villages of Hempstead, Garden City and Floral Park in the Town of Hempstead. Table 32 indicates the number of tracts in each of the Nassau towns and cities as of 1960, and their respective shares of all trade reporting a median age in the each of the four categories shown in the preceding table.

Twenty-six of the 220 tracts constituted the first group, those tracts whose population had a median age under twenty-five years; 62 constituted the second group; 81, the third; and 51, the fourth. The Town of Hempstead was well represented in all categories with a slightly higher than anticipated share of the oldest category. North Hempstead was winderrepresented in the younger two groups; overrepresented in the older two groups. Oyster Bay was over-represented in the younger two classes; under represented in the older two.

As might have been expected in view of the relatively slow growth of Nassau County in the 1960's, shifts in median age of the population often appear significant in the case of a tract or tracts but show little change on a town-wide or county-wide basis.

TABLE 32 NASSAU TOWNS AND CITIES: SHARE OF NASSAU TRACTS BY MEDIAN AGE CATEGORY, 1960

	No. of Tracts	Percent of All Tracts	Percent of	Tracts	With Medi	ian Age

### Suffolk 1970

In 1970 the median age of the population in each of the 206 Suffolk County census tracts ranged from a low of 16.17 years in tract 1581.01 in the Town of Brookhaven to a high of 62.00 years in tract 1227.03 in the Town of Babylon. Tract 1581.01, one of thirty tracts reporting a median age of less than twenty years, encompasses all of the recently developed area of North Centereach. North Centereach is located in the northwestern part of the Town of Brookhaven in the midst of some of the fastest growing communities in Suffolk County. Tract 1581.01 is not atypical of the County as a whole to the extent that the tract with the lowest median age is atypical of those in Nassau, since tracts with a median age of less than twenty constituted 14.5 percent of all tracts in Suffolk. Tract 1227.03, which comprises the Edgewood State Hospital, is somewhat atypical in that it possesses the decidedly abnormal age structure characteristic of the four hospital tracts for which reliable data is available. (A corrected age breakdown is not yet available for tract 1107 which contains the Northport Veterans Hospital). Four of the six Suffolk tracts with a median age of forty years or over are institutional tracts with a median age in excess of fifty years; the two remaining tracts comprise the entire Town of Shelter Island and the eastern most portion of the Town of Southold.

Table 33 shows the total number of tracts in each of the ten towns in Suffolk County and their respective shares of all tracts in each of the four median age categories.

One hundred eighteen, or well over half, of the 206 tracts constituted

TABLE 33 SUFFOLK TOWNS: SHARE OF SUFFOLK TRACTS BY MEDIAN AGE CATEGORY, 1970

		Percent of All	Percent of	Tracts	With Med:	ian Age

Southold	3	1.5	0.0	0.0	0.0	25.0
Total	206	100.0	100.0	100.0	100.0	100.0

Source: U. S. Census of Population, 1970

the first group -- those tracts with a median age of less than twenty-five years; fifty-six, or more than one fourth of all tracts, the second group; and twelve, the fourth. In general the western towns are overrepresented in the two younger categories and underrepresented in the two older categories, while the east-ern towns are underrepresented in the younger categories and over-represented in the older categories.

In 1960 the median age of the population in the 110 tracts into which Suffolk County was divided ranged from a low of 19.65 years in tract 1228 in the Town of Babylon to a high of 58.81 years in tract 1463 in Islip. Both the tract with the lowest median age in 1960, tract 1228, comprising a portion of Deer Park, and that with the highest, tract 1463, comprising Central Islip State Hospital were notably similar to their respective 1970 counterparts, tracts 1581.01 and 1227.03. Both tract 1228 (1960) and tract 1581.01 (1970) encompassed rapidly expanding communities of single family houses, at or near the leading edge of development. Both tracts 1463 (1960) and 1227.03 (1970) encompassed custodial care facilities of the New York State Department of Mental Hygiene.

Two tracts which amount to only 1.8 percent of the Suffolk total had a population whose median age was less than twenty years and five tracts or 4.5 percent had a population whose median age was over forty years. The two "youngest" tracts one in Deer Park and one in Central Islip included areas of recently built moderately priced houses. Four of the "oldest" tracts were institutional

tracts in 1960 as in 1970, although in 1960 only three of them reported a median age in excess of fifty years. The entire Town of Shelter Island constituted the fifth of the "oldest" tracts.

Table 34 indicates the number of tracts in each of the ten Suffolk towns as of 1960 and their respective shares of all tracts reporting a median age in each of the four categories shown in the preceding table.

Fourteen of the 110 tracts constituted the first or youngest group; 48, the second; 33, the third; and 15, the fourth. The towns of Babylon and Islip were considerably overrepresented in the two younger categories and underrepresented in the older categories, while the five eastern towns were underrepresented in the younger and overrepresented in the older groups.

Appendix Table IX, p. 120 which lists the median age by census tract, 1960 and 1970, together with the absolute and percent change provides more detailed information for specific areas.

## The Pre-School Population - 1970

#### Nassau

In Nassau the census tracts with the greatest number of children under five years were located, for the most part, in the east-central portion of the County. Thirty-four of the 55 tracts that reported pre-school population of 500 or more persons were in the Town of Hempstead; 12 tracts were in the Town of Oyster Bay, and four, three, and two tracts were in the Town of North Hempstead, the City of Glen Cove and the City of Long Beach, respectively.

Five of the tracts listed in Table 35 are located in areas having sizable concentrations of nonwhite residents; three are in areas with modest single family homes; and two are in areas with new apartment developments.

Six of the nine tracts that reported 10.0% or more of their inhabitants in the youngest cohort are in areas that also reported large numbers of nonwhite residents. Two tracts are in recently developed, relatively expensive waterfront communities; and one is in an area with new apartments.

Only the two Roosevelt and one New Cassel tracts appear among the ten tracts with the most and the ten tracts with the highest proportion of pre-school children.

#### Suffolk

In Suffolk the census tracts with the greatest numbers of preschool children are spread throughout four of the five western towns. Ninety-nine out of the 202 census tracts reported 500 or more children under five years in 1960 and 16 tracts reported more than 1,000. Seven of the tracts with more than 1,000 young children are located in the Town of Brookhaven; four in the Town of Islip; three in the Town of Huntington; and two in the Town of Smithtown. Table 37 lists the ten tracts with the greatest number of pre-schoolers, while Table 38, following, lists the ten tracts with the largest proportion of their population in the under five year group.

Source: U.S. Census of Population , 1970

All of the tracts listed in Table 37 are located in recently developed portions of four western towns -- Huntington, Smithtown, Islip and Brookhaven. The tracts listed in Table 38 are located in only three towns -- Smithtown, Islip and Brookhaven.

In Suffolk the figures for the number of pre-school children were generally higher than in Nassau tracts. When all 457 Bi-County tracts are ranked according to the count of persons under five, only one Nassau tract, 4140, appears among the first twenty-five in the Region. Similarly, in Suffolk, the proportion of the total population in the youngest age group is significantly larger than in Nassau. Pre-schoolers accounted for one tenth or more of the population in 196 or 47.5% of the Suffolk tracts, but in only 9 or 3.6% of the Nassau tracts.

# Changes in The Pre-School Population, 1960 - 1970

Map 3, p. 161 shows the ten year change in the number of pre-school children in each census tract. In order to permit the comparison of 1960 and 1970 data, those tracts that were split for the latest census have been reaggregated to conform to the 1960 tract boundaries.

Review of the map and of Appendix Table X, p. 134 which contains the information upon which the graphic representation is based, indicates that in Nassau only 28 out of 220 tracts recorded an increase in the number of residents under five years of age and that only one tract, 4142 in the Village of Freeport, reported a gain of more than 200 pre-school children. In contrast, 102 of the 192 tracts that recorded a decrease reported losses of 200 or more persons. Eighteen tracts, five in the Town of Hempstead and thirteen in the Town of Oyster Bay experienced reductions involving in excess of 500 children.

Decreases were widespread affecting all but a few Nassau communities where either the presence of apartments -- as in the villages of Manorhaven, Great Neck Plaza, Hempstead and Freeport; of significant numbers of new single family homes -- as in Oceanside, Merrick, Bellmore, Island Park, and Lido Beach; or of concentrations of non-white residents -- as in the Village of Freeport, the Village of Hempstead, Roosevelt and the City of Long Beach served to offset the general trend. The tracts that sustained the greatest losses are located, for the most part, in the east central portion of Nassau in areas that were subdivided and developed in the late 1950's. Many of the families who purchased homes in such communities as Hicksville, Plainview, and Massapequa still reside there today, but the pre-school children of 1960 have become the teenagers of 1970.

Fifty-five, or one-half, of the 110 tracts in Suffolk recorded gains and 55 recorded losses. Of those reporting increases, 35 added 200 or more persons under five years; 21 added 500 or more. Of those reporting decreases, only 17 experienced reductions involving 200

or more persons; two experienced reductions of 500 or more.

The geographic distributions of gains and losses generally appear to be related to the age of housing. Thus, the portions of the towns of Huntington and Babylon that were developed in the 1950's or earlier seem to follow the east central Nassau pattern of more losses than gains while in the more recently settled areas in the two western towns, in Southampton, much of Islip and most of Brookhaven, gains appear to be the rule and losses the exception. In the East End towns the pattern changes again with all but two of the farm and resort area tracts reporting fewer pre-school children in 1970 than in 1960.

# The Elderly Population - 1970

#### Nassau

Although persons aged 65 years and over are found in considerable numbers throughout most of the county, the tracts with the greatest senior citizen population are generally concentrated in the City of Long Beach and in the older villages of west and southwest Nassau. Eighty out of the 255 Nassau tracts reported 500 or more elderly residents and eight tracts reported 1,000 or more. Table 39 lists the ten tracts with the greatest number of persons 65 years and over, while Table 40 lists the ten tracts with the largest proportion of their population in the oldest age group.

Six of the ten tracts listed in Table 39 comprise villages or portions of villages; three comprise portions of the City of Long Beach, and one comprises a portion of an unincorporated community. All but one of the tracts contain a considerable number of multifamily dwellings. That tract, 4074, is the site of the A. Holly Patterson Home for the Aged.

The Long Beach tracts, plus the Great Neck Plaza and Rockville Centre tracts appear among those with an unusually high proportion of elderly residents listed in Table 40.

#### Suffolk

In Suffolk, the three state hospital tracts led all others in number of inhabitants 65 years of age and over in 1970. However,

when institutional areas are excluded, the tracts with the greatest number of elerly inhabitants are found throughout the East End towns and in the older incorporated villages and hamlets such as Amityville, Patchogue, and Bay Shore. Concentrations of senior citizens are also common in such areas as Mastic Beach, Sound Beach, Rocky Point, and Lake Ronkonkoma where "winterized" seasonal bungalows and cabins provide low cost housing for persons with limited incomes. Fifty out of the 202 Suffolk tracts counted 500 or more senior citizens; eight tracts counted 1,000 or more. Table 41 lists the ten tracts with the greatest numerical concentrations of elderly persons while Table 42 lists the ten with the largest proportion of the population in the oldest age group.

Three institutional and seven non-institutional tracts appear in each of the above tables. Of the seven listed in Table 41, three are located in the Town of Southampton; two in the Town of Southold; one in the Town of Riverhead, and one in the northeast part of the Town of Brookhaven adjacent to the Riverhead-Brookhaven boundary. Of those listed in Table 42, two are located in the Town of Southampton; two in the Town of Southold; and one each in the towns of Shelter Island, East Hampton, and Brookhaven. The Brookhaven tract, in the southeast sector of the town comprises the part seasonal - part year-round community of Mastic Beach.

### Changes in the Elderly Population, 1960 - 1970

Appendix Table XI, p. 145 shows the change in the number of persons 65 years and over in each census tract. As in Appendix Table X, tracts that were split for the latest census were reaggregated to conform with the 1960 tract boundaries in order to permit comparison of the 1960 and 1970 data.

Nearly all of the Nassau tracts -- 211 out of 220 -- recorded increases in the number of elderly residents. Eight recorded decreases and one recorded no change. Gains varied in magnitude from the addition of one person in tract 4132 in Oceanside to the addition of 1686 persons in tract 4167 in the City of Long Beach.

Losses ranged from a ten person decrease in tract 3026 in the Village of Floral Park to an 83 person decrease in tract 5183 in Syosset.

Increases exceeded 500 persons in four tracts and 1,000 persons in one tract. Table 43 lists the ten Nassau tracts with the greatest

ten year increases in population in the oldest age group.

Gains were widespread and for the most part reflected the normal aging of the county's population. The largest increases such as those indicated in Table 43 occurred either in areas that had the type of housing facilities, services, and amenities that tended to attract or retain older residents or in areas experiencing rapid overall growth affecting all components of the population.

In Suffolk, the pattern was similar. One hundred-six tracts recorded increases; #our, all institutional areas, recorded decreases. The increments varied in size from the smallest, 52 persons in tract 1471 in the Village of Brightwaters, to the largest, 1290 persons in tract 1583 in north central Brookhaven. The losses in the four hospital tracts ranged from a 91 person decrease in tract 1348 to a 920 person decrease in tract 1463. Increases exceeded 500 persons in 15 tracts and 1,000 persons in one tract. Table 44 lists the ten Suffolk tracts with the greatest ten year increases in population in the oldest age group.

Source: U.S. Census of Population, 1960 and 1970

In most Suffolk tracts and especially in those tracts listed in Table 44, the rise in the number of senior citizens is attributable primarily to the extraordinarily rapid growth in all age groups.

The attractions of shorefront and other central and eastern Suffolk areas and the normal aging of the population while locally significant, appear to be of less importance on a county-wide basis.

### Projected and Reported Population, 1970

County-wide projections for the eighteen age groups -- the five year cohorts and the 85 years and over class -- were developed as part of the background studies for the Bi-County Comprehensive Plan. Cohort survival techniques were utilized to "age" the population from the base year of 1965 to 1970, 1975, 1980, and 1985. National age-specific fertility rates and national census survival rates were used to develop estimates of net natural increase, while past trends, modified to reflect changing conditions, were used to develop estimates of migration.

The series of projections that resulted from the application of cohort survival techniques generally yielded higher figures for the total population of both Nassau and Suffolk than the series of projections based upon land capacity analysis (See Census '70, Vol. 1, p. 14). Although the cohort survival estimates appeared unrealistically high, especially for Nassau, they did seem to provide a reasonably reliable picture of the probable age structure of the population.

It is now possible to compare reported and projected population by age for 1970. Appendix Table XII, shows the two sets of figures and the differences between them for the counties and the Region.

On a Bi-County basis, differences range from as few as 1509 more persons reported than projected in the 10-14 year cohort to as many as 41, 926 more persons projected than reported in the "under five years" cohort. In the counties, absolute differences between projected and recorded figures are of lesser magnitude; relative differences are of greater magnitude than in the Region.

Unfortunately, in 1966 there was insufficient or inadequately documented experience upon which to base local age-specific birth rates and life tables. It was therefore necessary to rely upon the national rates, and the staff, after examination of the 1960-1965 vital statistics for the counties, selected series "D" and series "C" fertility rates as most appropriate for Nassau and Suffolk, respectively, and the census survival rates for whites, as most appropriate for both counties. It now appears that the

national rates were poor proxies for local rates in the case of two important age groups: children under ten years and adults over fifty.

The drop in the birth rate was far in excess of the decline antici-In fact, the largest discrepancy between actual and projected numbers is found in the youngest age group in Nassau, which recorded 27.7% fewer persons than expected. Somewhat smaller discrepancies are found in the youngest cohort in Suffolk and in the 5-9 year groups in both counties. The projections underestimated the numbers in the 10-14 year class in Nassau and Suffolk and in the 15-19 year class in Suffolk. Although the differences between projected and actual numbers are small, they suggest that either the Region's health or access to health care is excellent and hence the probability of survival is greater than in the nation as a whole, or that the decreasing availability of moderately priced housing has tended to attract older more affluent families with more teenagers than tots. The rather large difference between projected and recorded population in the 20-24 year group -- 29,675 persons in the Region as a whole -- seems to reflect the export of college and university students to institutions outside the Bi-County area. may also reflect a lack of housing accommodations, especially apartments, at a price that young households can afford. The lower than anticipated growth in the cohorts in the 25-49 year group in Nassau and in the  $3\theta-44$  year group in Suffolk seems to be related, for the most part to the diminishing supply of low and even moderate cost housing. The consistently low projections in the older age groups suggest that the national census survival rates are inappropriate indicators of the potential longevity of Nassau and Suffolk residents

and that their use has resulted in an underestimation of the number of older persons in the Bi-County population.

The age composition of the projected population and the reported population are considerably closer to one another than the raw figures would suggest. In only two age groups in Nassau -- the "under five years" and the 20-24 cohorts -- and in only one age group in Suffolk -- the five to nine year cohort were the differences in the respective shares of the population more than 1.0% apart.
