ANNUAL REPORT OF THE STATE UNIVERSITY AT STONY BROOK REGIONAL DATA BANK

March 31, 1969

As a result of discussions held between members of the university administrative staff, representatives of the Economic Research Bureau, the Technical Assistance Office and the Computing Center, and in recognition of stated needs as expressed by representatives of County and Regional Planning Commissions, the Regional Data Bank was established at the University Computing Center in early 1968.

Initially, the purposes of the Data Bank have been two-fold:

1. to establish a repository of machine readable data regarding the surrounding geographic area (Long Island), and to service the needs of the academic departments insofar as they would require this and other data dealing with our environment (social, economic, demographic, etc.) and
2. to co-develop, along with personnel from County and Regional agencies, a data bank concept, especially in regard to processing and manipulating the information that has been and would be acquired and given to us by those organizations.

During the first year, the larger part of our efforts has been devoted to developing techniques for manipulating the various data files that we have received from the County and Bi-County Planning Commissions. The academic departments have not called on us to any significant extent, however, we are hopeful that the information that we have obtained, or have rapid access to, along with techniques that have been developed, will, in the future, prove useful. Some of the work that has been done, has already proved to be extremely valuable to the County and Regional agencies. Some of these projects are briefly summarized on the following pages.

We wish to thank members of the Computing Center Management and staff for their support during the past year and express our appreciation to Dr. Marvin Kalkstein of the Technical Assistance Office for his efforts in establishing the Data Bank initially and in building and maintaining a harmonious working relationship with the County and Regional Agencies.

WALTER F. DUNNE
TECHNICAL ASSISTANCE OFFICER
COMPUTING CENTER

II. REGIONAL DATA BANK ACTIVITIES AT THE STONY BROOK COMPUTING CENTER

Over the past year, our activities have involved providing computing and data bank services to the following groups:

1. The Nassau Planning Department
2. The Suffolk Planning Department
3. The Nassau-Suffolk Bi-County Planning Commission

Most of the services have been in regard to the following:

1. A comprehensive analysis, by computer, of all apartment buildings in the two counties. Given certain raw data, which was obtained via survey, we have computed pertinent statistics such as school taxes, average rents, average parking ratios, etc., for each of the more than 300 buildings in the two counties. In addition, these statistics were also produced in summary form for each community, for each school district, and for the counties. (See Attachment A for sample summations on Suffolk-Nassau.)

2. A cross tabulation of the socio-economic characteristics of the tenants of these buildings. The basic data was acquired via a mail questionnaire, from which some 5,000 responses were received. The Computing Center, using the Bio-Medical Statistical Packages, produced cross-tabulations and correlations for such variables as children per unit, autos per unit, rent per unit, tenants' prior residence, ages of children, children in school, children pre-school, children out of school, age of household head, type of apartment, bedrooms, etc. (See data bank inventory and Attachment B)

3. A computer analysis of Brookhaven in transition.

Responses from residents of three communities were cross-tabulated and correlated. Socio-economic characteristics as well as housing information for this segment of the Brookhaven population were processed and once again, cross-tabulations and correlations were produced. The information will, along with subsequent studies, be used to detect when other towns and communities in the region are tending toward transition from seasonal to a year round economy, thus enabling the Planning Commissions to make more accurate and meaningful predictions. (See data bank inventory and Attachment C)

4. SYMAP¹- Stony Brook computers have been producing maps for the Planning Commissions. Thus far, the data mapped has consisted of population statistics compiled in 1960 and 1965. This information is produced using conformant and contour mapping techniques whereby each census tract is ranked according to its population density. The possibilities here are many. We understand that the Police Departments are also interested in mapping crime areas and using these to make certain personnel allocation plans. The Health Departments are also expecting to make use of these mapping systems.

5. Recently, we have developed Fortran IV routines which, when used to process the input data to SYMAP, enables us to search for mobility information for any specified area in Nassau County,

1. SYMAP (Synagraphic Computer Mapping) is a Fortran IV program developed at Harvard University's Laboratory for Computer Graphics.

count it, create densities and then to map the results of these computations. (See Attachment D) In effect, we are creating maps which indicate the preponderance of mobility or lack of it, for trips of any particular type or all types, for any specified area or many areas. This output has proved its usefulness to groups within local planning agencies involved with poverty area studies and also to those groups concerned with transportation problems. In particular, SYMAP output has provided a means of graphically depicting transportation patterns and is being used to justify requests for funds. More importantly though, for the first time, we have taken information gathered by an outside source, sorted it, retrieved and manipulated it in a variety of ways. Clearly, these techniques will be the basis for more comprehensive computer analyses, in particular, the Census Tapes of 1970.

6. We are cooperating with Wilbur Smith and Associates, a transportation consulting firm under contract to the Bi-County Planning Commission. It is expected that this cooperation will result in a transportation model for Nassau and Suffolk Counties being set up on the 360 System at Stony Brook. County and Regional Planning personnel as well as interested members of the university community will then experiment with the model, studying the effects of new roads, population increases, new bridges, new industries, making projections, etc.

HOUSING SURVEY

INTERVIEW

1. (check one) Owner _____ Renter _____
2. a. How long have you lived in this building? _____ in this Country _____
b. Do you live here all year round? Yes _____ No _____
If not, where do you live in the winter? _____
c. When you first occupied this house did you live here summers only? _____ all year? _____
d. Have you ever occupied another house in this area?
Summers only _____ all year? _____
3. The Dwelling Unit:
 - a. Total number of rooms _____ Bedrooms _____
 - b. Number of families in unit _____
 - c. Total number of persons in unit _____
 - d. Number of rooms in unit rented to non-family members _____
 - e. Heating facilities: Central _____
Other (specify) _____
None _____
 - f. Fuel used (Specify) _____
 - g. Water Supply:

	<u>In Kitchen</u>	<u>In Bath</u>
Running hot	_____	_____
Cold only	_____	_____
None	_____	_____
 - h. Private flush toilet in unit? _____ if not, where? _____
 - i. Private bath or shower in unit? _____ if not, where? _____

4. Where-in what location--does the head of the household work? _____

Other employed family members? _____

5. How does he (do they) get to work? _____

6. Do you own a car? _____

7. Employment: (Fill out columns 1 through 4 for each person living in dwelling unit whether employed or not.)

*use the following code:

- | | |
|---|--|
| 1. Regularly employed | 4. Retired (and over 65). |
| 2. Seasonal, occasional,
or temporary employment | 5. Not working because underage |
| 3. Unemployment but looking
for a job. | 6. Other unemployment or not
interested |
| | 7. On Welfare |

8. OWNERS ONLY-Conversion

a. Was this house originally built for seasonal use? Yes _____

No _____

b. What changes were made to permit year-round use? _____

c. Did you make these changes or were they made by a former owner? _____

d. Approximate date of conversion _____

f. Do you contemplate additional improvements? Yes _____ No _____

9. OWNERS ONLY-Household Expenses

What is your average expense for the following housing items?

(If item is not applicable indicate "N/A")

a. Total mortgage payment. Indicate if any items below are included in this payment. _____

b. Monthly cost of home improvement load(if any) _____

c. Heating (per year) _____

d. Water _____

e. Gas, Electricity (per month) _____

f. Taxes (per year) _____

g. Insurance (per year) _____

h. Repairs or improvements made in recent years
(not covered in 11b) _____ Cost _____

_____	_____
_____	_____
_____	_____
_____	_____
_____	_____

10. OWNERS ONLY

Total rental income, if any: Amount _____ Source _____

11. TENANTS ONLY
- a. Rent paid monthly _____
b. Gas, Electricity and other Utilities _____
c. Total _____
12. a. What attracted you to this area? _____

- b. Do you like living in this house? Yes _____ no _____
Why? _____

13. Do you have relatives residing in the area? Yes _____ No _____
14. a. in what ways do you think the neighborhood has changed from
what it was when you first moved here?

- b. Do you think these changes are for the: Better _____
worse _____
no opinion _____
15. What prompted you to convert the house? _____

16. a. What services are needed in your neighborhood?
- | | <u>Need</u> | <u>Don't Care</u> | <u>Don't Need</u> |
|-------------------------|-------------|-------------------|-------------------|
| Roads (paved, improved) | _____ | _____ | _____ |
| Schools | _____ | _____ | _____ |
| Parks | _____ | _____ | _____ |
| Sewers | _____ | _____ | _____ |
| Public Transportation | _____ | _____ | _____ |
| Other | _____ | _____ | _____ |
17. Other Comments (use reverse side)

Environmental Conditions: _____

Comments:

ATTACHMENT D

The maps on the following pages are dealing with population and trip information. The first exhibit is a contour map of population density for Nassau County, derived from population statistics compiled in 1965. In this process, population count information is sorted into census tract sequence and fed to SYMAP. In order to arrive at a density figure, it is necessary to run a preliminary conformant map for the county and obtain relative areas for each of the 240 Census Tracts.

An input subroutine creates density areas by factoring the relative area for each tract and using this figure along with total tract population count to compute density.

The second and third exhibits are referred to as conformant. That is, each individual tract is illustrated exactly as defined by its coordinates and a value assigned to its population density. There is no contour algorithm applied in this process.

Exhibits 4, 5 and 6 illustrate a trip density analysis. In this process, a Tri-State Transportation Commission Survey was used as the basic input. Home interview records were sorted to origin-destination tract sequence and an input subroutine for SYMAP was developed. This subroutine allows the user to select any given tract of origin for analysis. The routine searches for the selected tract and then counts the trips going off to every other area. A density is computed and the values are presented to the mapping function. A further refinement of this process allows for the selection of type of trip.
